(published in Journal of Transport Geography)

Definition:

‘the extent to which one or multiple characteristics of the preferred travel behaviour alternative can be substituted by alternatives’

- Activity (location)
- Mode
- Route
- Time

Related to:

- Freedom of choice
- Accessibility

WE ♥ CHOICE

*m*obile
@accessibility

Figure 1 : Stylized example of (a) a high level of accessibility, and a low level of substitutability, and (b) a low level of accessibility and a high level of substitutability.

Relevant for conceptualization:

- **Gradual concept**
- **Normalized or not?**
- **Additional value of additional options**
 - **Diminishing**

Relevant for conceptualization:

- **Overlap**
- **Individual versus social choices**
- **Pre trip, on trip, during activity program**
- **Return trip: limitations**

Aggregation level of the level of substitution.

We distinguish:

1. Components of trips for one person
2. A full trip or activity for one person
3. A cluster of activities/ trips for one person
4. An aggregation of the three levels above, but now for a group of persons
5. The perspective of the origin or destination of the trip

Mathematics

Multiple options. Our choice:

- **Higher values of indicator: higher levels of substitution**
- **Normalized between 0 and 1**
- **Logsum based**

- **Multiple formula tested – (best) one presented**

Mathematics - proposal: Logsum based

$$LS_n = \ln \left(\sum_j e^{V_{jn}} \right) + C$$

Relative decrease without best alternative(s)

| | |
|---------------------------------|--------------|
| $S_n = \frac{1}{LS - LS^{Y=i}}$ | (equation 2) |
|---------------------------------|--------------|

Includes uncertainty / probabilities

| | | |
|---|--------------|--|
| $S_n = \frac{1}{LS - \sum_{i=1..J} P_i \cdot LS^{Y=i}}$ | (equation 3) | |
|---|--------------|--|

Normalize between 0 and 1

$$\hat{S}_n = 1 - \frac{1}{1 + S_n}$$

Application

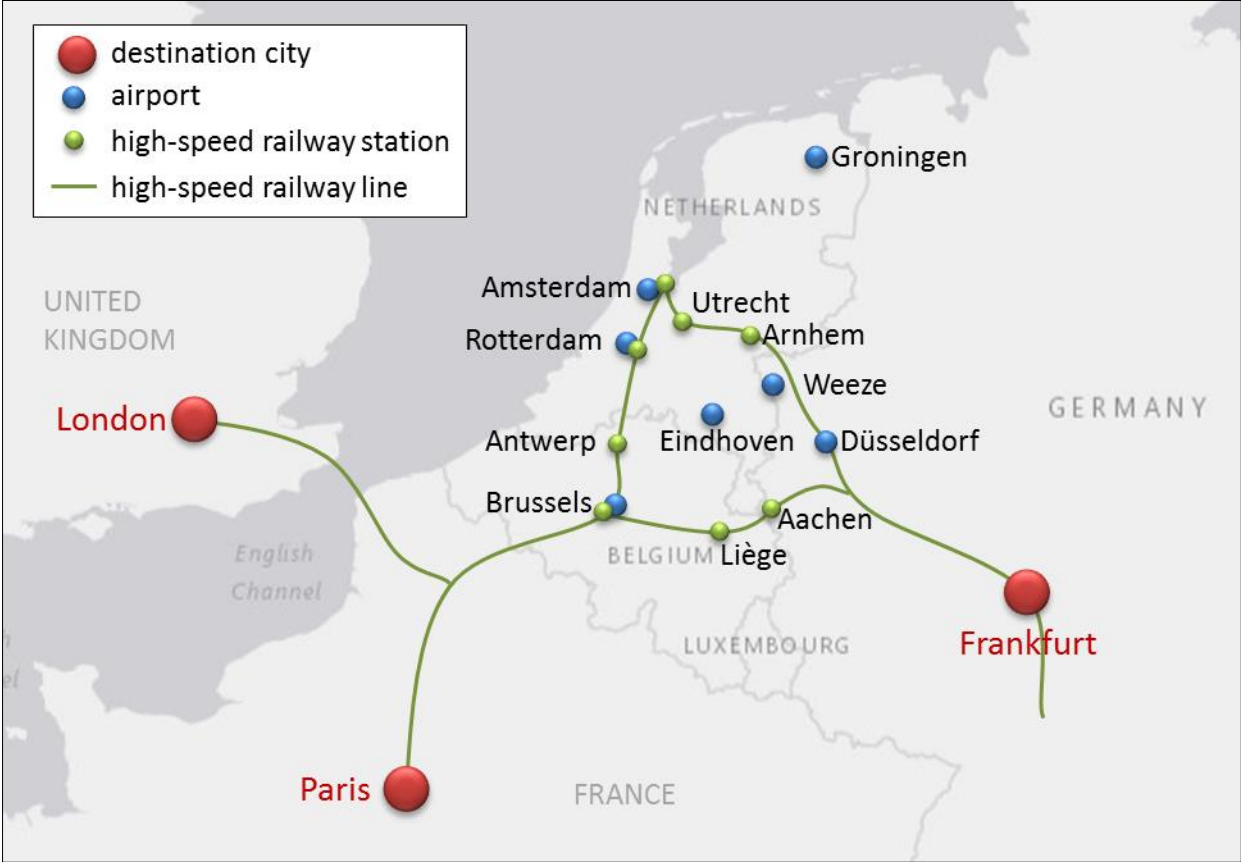

Figure 3 Logsum and substitutability by air, with driving as access mode

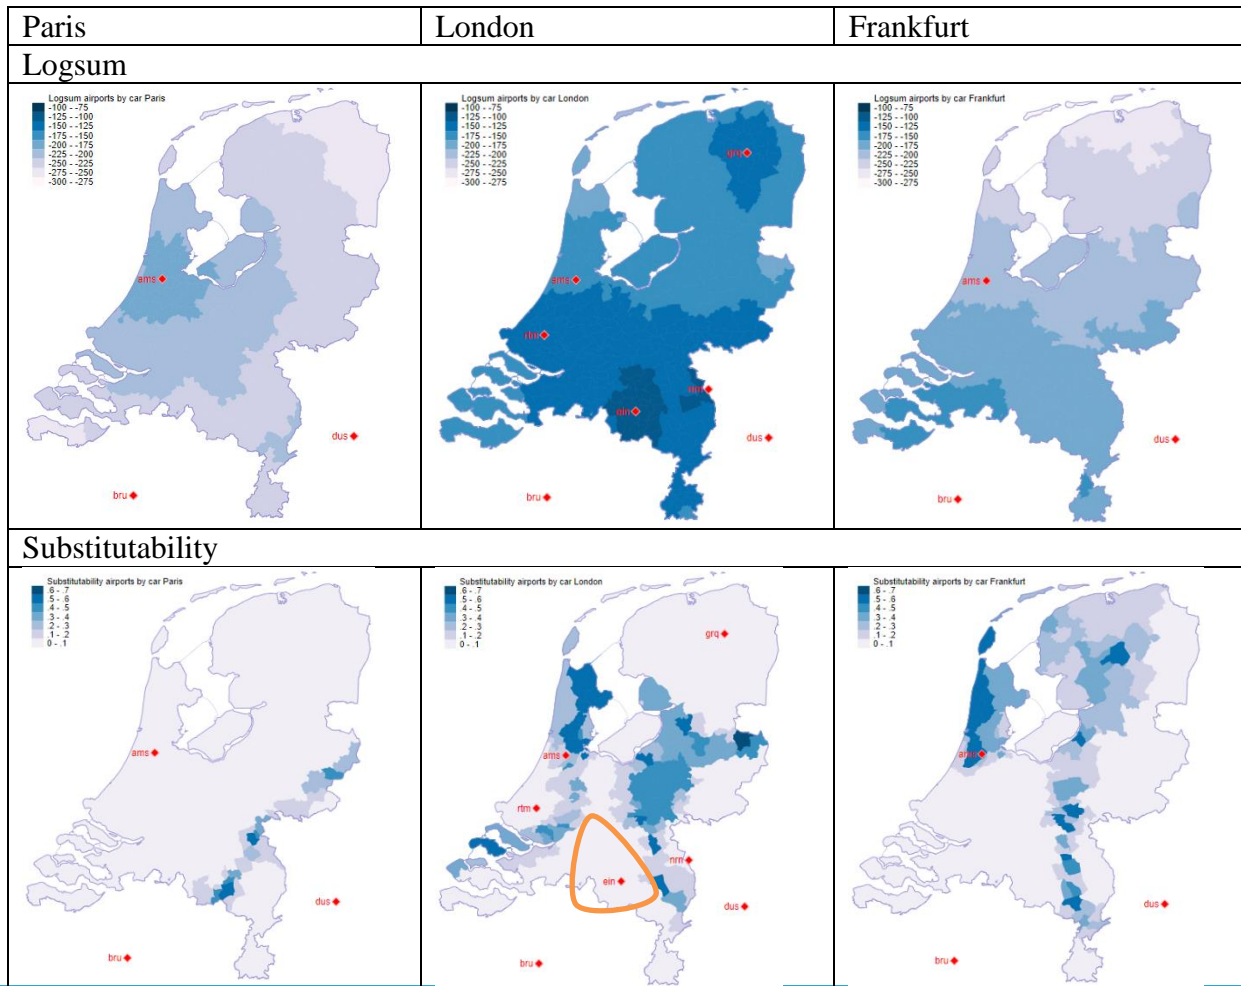

Figure 5 Logsum and substitutability by air and high-speed rail, with driving as access mode

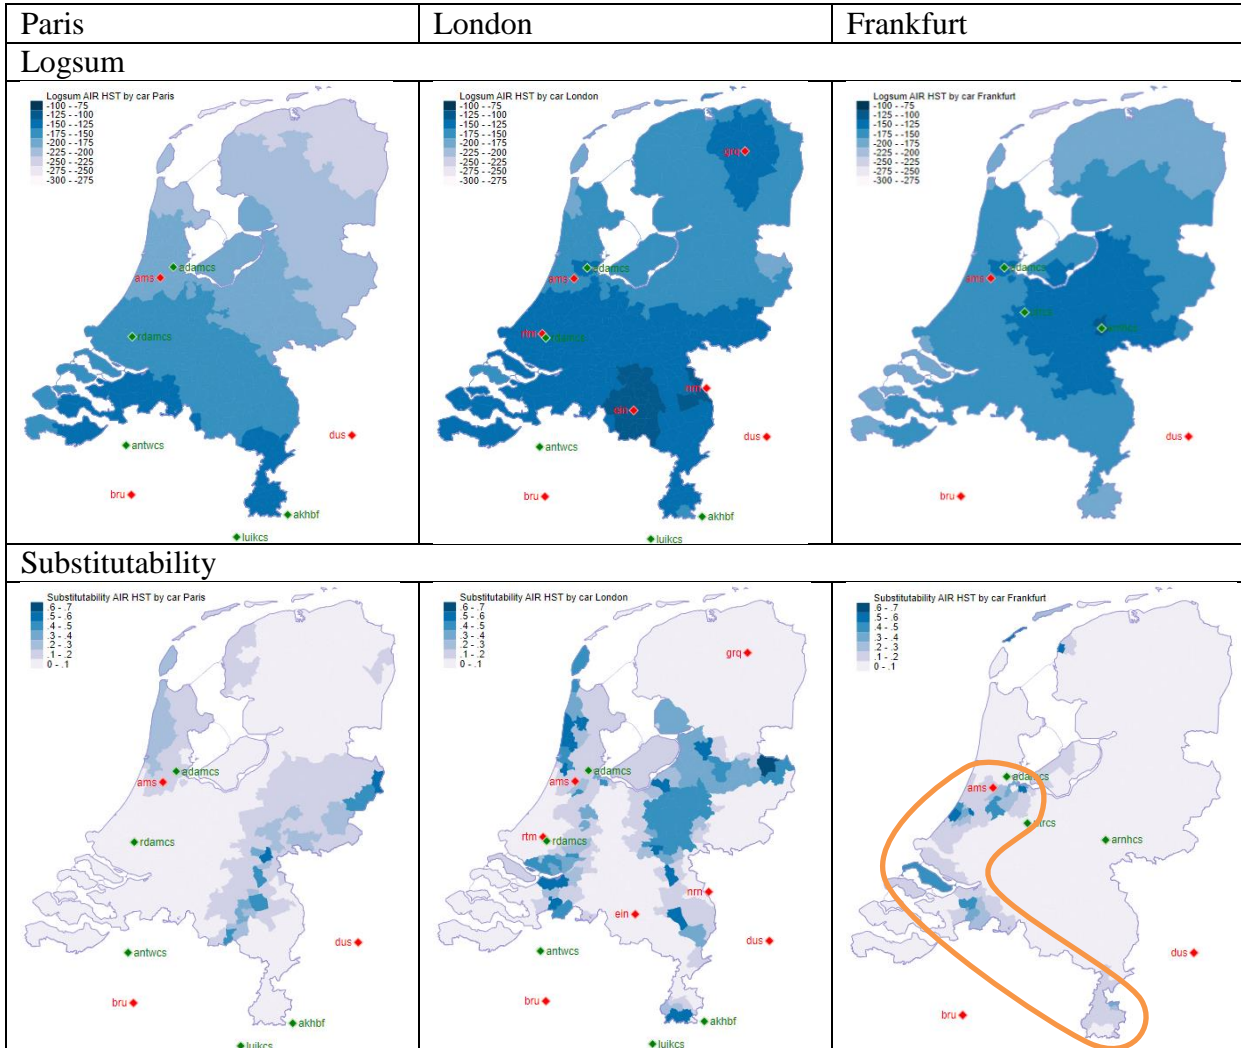

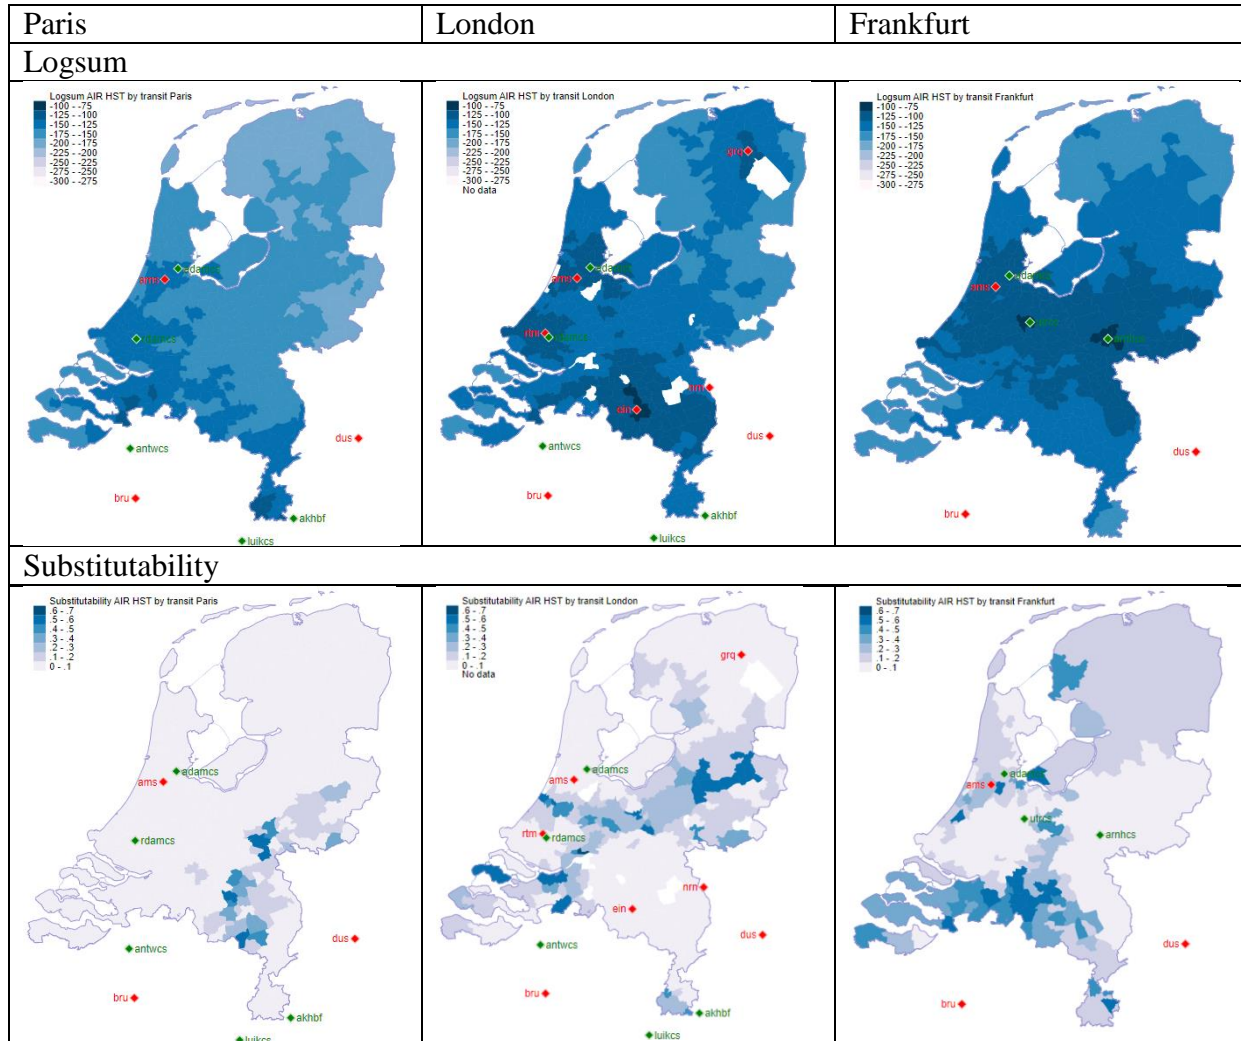

Figure 4 Logsum and substitutability by air and high-speed rail, with public transport as access mode

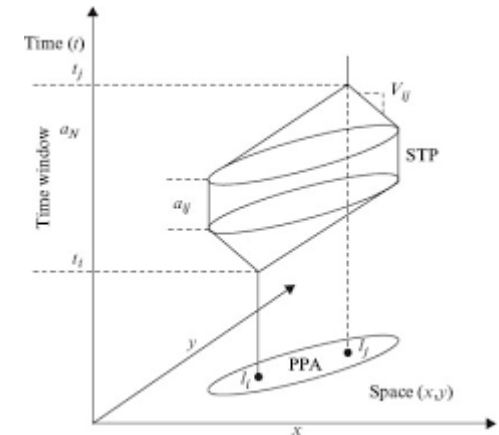

Conclusions case study

- **Doable!**
- **Results not immediately intuitive, but can be explained**
- **Substitutability not comparable to Logsum accessibility**

Research agenda:

- Alternative formula
- Methodology disentangling contributions of components of LU and Transport system
- Empirical research: perceptions substitutability
- Role of constraints
- Role of ICT

- Interactions between dimensions (e.g. transport and land use)
- Implications for modelling
- What do clients want?
- Link with evaluation frameworks

- Policy implications

Concluding remarks

- Goods transport
- More than transport
